SignDex

SIGNDEX | SignDex vs. SignNow

Digital signing for your business.
Your storage. Your signing identity. Your workflow.

Every signer gets a certificate-based digital signature as standard with SignDex.

SIDE BY SIDE

SignDex

WHY CHOOSE SIGNDEX

Individual signatures. Identity checks. Better value

Your documents, your storage

Organisation admins can configure company-owned cloud file storage, such as Azure Blob Storage, Amazon S3 or other cloud file-storage services, to align document storage with company requirements.

A certificate-based signature for every signer

Each signer applies an individual certificate-based digital signature by default. Organisations can request built-in e-KYC checks for standard signing too; verification is required for Trusted ID signing.

HOW THEY DIFFER

More control over storage and signing choices

SignDex includes a certificate-based digital signature for every signer by default. SignNow's standard eSignatures are typed, drawn or uploaded signatures supported by an audit trail; certificate-based signing is available separately through certificate import or integrations, depending on plan and setup.

SignDex: individual signatures as standard

Data residency in your control
Your data is stored on local servers in Malaysia, so it stays in-country.

- Certificate-based signature for every signer, included by default
- Sequential, parallel and quorum signing
- Bring Your Own Storage
- Built-in e-KYC for standard and Trusted ID signing

SignNow: an eSignature and workflow toolkit

Data hosting location
Local data hosting in Malaysia is not listed on its website.

- Standard eSignatures are typed, drawn or uploaded; certificate-based (PKI) signing through certificate import, depending on plan and setup
- Role-based signing order; quorum signing not listed
- Cloud storage integrations, such as Google Drive and Dropbox
- Signer authentication by password, SMS code or phone call
